

Final Project Summary

CMP-262-26599

Elizabeth Trunk

5/11/2026

Tools Used

- Jupyter Notebooks
 - Python Pandas
 - Matplotlib
 - Seaborn

Questions Asked

1. What is the distribution by county of waterfalls that are sourced from the Delaware River?
2. Out of the municipalities with more than 3 waterfalls, which ones have the biggest on average?
3. What were the waterfalls with the top 10 cascade heights that are cascade-type waterfalls?
4. Is there a correlation between waterfall type and total height?

Insights that were discovered

1. Most waterfalls in New Jersey that are sourced from the Delaware River are in Sussex County.
2. Alpine has the largest waterfalls on average, and Kingwood has the largest cascades.
3. Top 10 is listed to the right. Lost Brook Falls in Tenaflly has a significantly higher cascade than the rest.
4. There may be a slight correlation between the two variables, but there is not enough data to say for sure.

name	height_cascade
Lost Brook Falls	75.0
Big Tocks Creek Falls	35.6
Rutherford Falls Upper	35.0
Boonton Falls	32.0
Tumble Falls 3	30.0
Maple Falls	29.5
Van Campens Glen Falls	27.3
Tumble Falls 4	27.0
Tumble Falls 1	25.9
Hemlock Falls	25.7

Recommendations

My client would probably be an environmental researcher, so I would recommend that they expand their data to reach more states. There is a decent amount of data in this dataset but if they want a better analysis, other waterfalls in the northeast might need to be considered.

Future work

I would come up with different questions. In the end, I wasn't really satisfied with the questions and answers I had. Next time, I will familiarize myself with the dataset more to come up with more productive questions.
